The best of open sources software…

The development of a huge ever-growing group isn't just going to be a short and sweet one, let me tell you with more and more big name developers getting behind the open source community, major things are going to come out. You may not even know that your devices is running on open source software. Things like Android and some popular laptops are running on open source operating systems.

One of the better benefits of the open-source, and just to prove my point I will give you a little example. Lets say that you are using the amazing piece of software that you found online and you have been using it in your day to day life to do your work, but the developer looses faith in the project and stops developing for it. You are hart broken. Thanks to the open source community the software that was dropped in development yes the one that you loved using, all of its source code is up online and has now the project have caught the attention of a small developer who wants to carry on development of the software. If this was a non open-source project then the software would eventually become out of date and unusable over time. That is why it is a lot better to use open-source software and developing open-source software you will be able engaged with the community a lot more.

It is also just a matter of choice and freedom, for every program that you use on your computer there is a open source alternative. Yes i do understand that it is a pain trying to get used to a new piece of software compared to what you used to use. Honestly this is for a good cause though and will benefit in the long run. I mean in the last few years software like linux has been taken up by some big name brands such as google and worked into some huge pieces of hardware. I mean the wide range of chrome books are currently running on open source software.

One of the best thing about open source software is the fact that it will work with anything and that it is a totally open echo system. Where as things like apple is extremely locked down to their own brand software. Which sucks. I mean it I am currently using android phone and a linux compute it works amazingly. I get all of the notifications off of my phone straight onto my desktop. I am even

currently using apple music which I know is not a open source application but even with the open source software that I use on a daily basis still works perfect.
